

procedure:

- create a dataset with two sheets with sheet 1 (month, sales), sheet 2 (month, product, sales).
- import the excels in tableau.
- create line chart for monthly sales analysis.
- create bar chart for product sales comparison.
- developed a scatter plot between advertising budget and sales.
- Build an interactive dashboard using the charts.
- applied filters to enable interaction

procedure:

- open Tableau & import the sales & customer satisfaction dataset
- create histogram using the Age field to visualize the distribution of customer age.
- create pie chart using the satisfaction score field to show the percentage distribution of customer age
- create pie chart using the satisfaction score field to show the percentage distribution of customer ratings
- Build a stacked bar chart by placing Age group & satisfaction score to analysis satisfaction level.
- Arrange all visualization on a dashboard for better analysis & presentation.

procedure:

- import the employee performance dataset into Tableau.
- create line chart to visualize employee performance trends over time.
- create bar chart to show employee distribution across departments.
- Add title, labels, & filters & interact the dashboard.

procedure :-

- > import the product inventory dataset into ~~tableau~~ Tableau.
- > create Bar chart by placing product ~~name~~ Name on column & quality on rows.
- > create stack & also a scatter plot for the dataset.
- > create a dashboard to interact using filter.

Procedure:

import the website traffic dataset into Tableau

Create line, bar chart by placing in correct portion according to the dataset values.

→ create stack Area chart using user interactive

→ create a dashboard and add the line chart & bar chart.

procedure:

→ open tableau and connect the product sales excel dataset.

→ ~~plot~~ Month wise sales for each product using group bar chart.

→ visualize the overall sales trend of all products across three month.

→ combine all the one into dashboard & enable filters for analysis.

Procedure:

- Open Tableau and connect the Customer demographics data set.
- Plot Customer ID on X axis & Age on Y axis to visualize
- Display Customer ID, Age, Gender, Income in Tabular format.
- And using filter interact in dashboard.

Procedure:-

→ open tableau and collect survey response data & organize it in tabular format

→ import dataset in Tableau

→ verify & clean data to ensure accuracy

→ create visualization such as bar chart, pie charts or histogram.

→ And interpret the result to identify key insights.

Procedure:-

→ collect details of employee as excel file

→ import into Tableau & create a visualizations.

→ such as bar, pie, scatter & dashboard to compare employee performance.

→ And interact using filter.

procedure:-

→ Load online learning activity dataset into R program.

→ Clean & process the data

→ create visualization bars, charts using R program.

→ interpret the results to identify learning behavior patterns.
